Basics of python

```python
print("hello world")
```

        hello world

```python
a="laraib"
b="hello i am "
print(b+a)
```

        hello i am laraib

```python
a=5.6
print(type(a))
```

        <class 'float'>

```python
b=9
print(type(b))
```

        <class 'int'>

```python
c="h"
print(type(c))
```

        <class 'str'>

```python
a=str(2.3)
print(type(a))
```

        <class 'str'>

```python
c=float(4)
print(type(c))
```

        <class 'float'>

```python
a=b=c="python"
print(a,b,c)
```

        python python python

```python
e,x,y,z="we","learn","python","successfully"
print(e,x,y,z)
```

        we learn python successfully
